Which part of the BMS manages the battery

What is battery management system (BMS)? Battery Management System (BMS) is the "intelligent manager" of modern battery packs, widely used in fields such as electric vehicles, energy storage stations, and consumer electronics. What is a battery management system? A battery management system, or BMS, is an electronic monitoring and control system that manages rechargeable battery packs found in electric vehicles, renewable power stations, uninterruptible power supplies, and other advanced applications requiring efficient battery operation. What is a BMS control unit? The control unit processes data collected from the battery and ensures that the system operates within its safe operating area. A critical part of the BMS, this system uses air cooling or liquid cooling to maintain the temperature of the battery cells. Why do batteries need a battery management system? Batteries store more than just electricity. In a world desperate to transition to renewable energy, batteries store the promise of a greener future. And to fulfill that promise, they need the help of a battery management system, or BMS. Why do EVs need a battery management system? EVs rely heavily on a robust battery management system (BMS) to monitor lithium ion cells, manage energy, and ensure functional safety. In renewable energy, battery systems are crucial for storing and distributing power efficiently. The BMS ensures the safe operation and optimal use of these systems. How does a BMS monitor a battery pack? To monitor the status of each cell in the battery pack, the BMS employs several types of sensors: Voltage sensors: These sensors measure the voltage across each cell in the battery pack, providing critical data to the microcontroller. The BMS is typically an embedded system and a specially designed electronic regulator that monitors and controls various battery parameters (e.g. temperature, voltage, and current) to keep the battery cells within a safe working range.
